

ABSTRACT OF THE DISCLOSURE

A coffer maker includes a support unit having a base member formed with a neck that extends inwardly from a side portion thereof and that defines a bottom recess in the base member. A brewing unit is mounted on the support unit. A position adjustable control unit is mounted movably on the neck, extends into the bottom recess in the base member, and includes a control seat projecting outwardly from the bottom recess, and is formed with a plurality of control switches electrically connected to the brewing unit.
